

T-BLOCK

Ergonomics is a science concerning the adaptation of work tools to man's natural prerequisites. This process helps develop tools that reduce the risk of injury through accidents and strain. This science lies behind the development of **T-BLOCK**.

The **T-BLOCK** series offers three different handles for different hand sizes, tasks and head weights.

The handle is grooved and rubber like, which gives a good grip even with perspiring and oily hands.

The counterweight gives improved balance and control as well as a natural rotation for the hand.

The head is filled with small steel balls that reduce the impact and recoil.

You can grip along the entire length of the handle depending on whether you need force or precision.
